Gardening in a Changing Climate
Dr. Linda Chalker-Scott, Extension Urban Horticulturist and Associate Professor

Gardeners know that the climate is changing - they can see evidence in their own gardens and landscapes. Drier, hotter summers and unpredictable swings in weather throughout the year are challenging plant survival and soil health. This seminar will provide strategies that will help your plants and soils “weather the weather.”

Don’t fall into the pseudoscience trap! These practices are NOT science-based and will NOT help

- Amending the soil before planting
- Native plant superiority
- Avoiding hot weather watering
- Permaculture
- Hügelkultur
- Using water crystals
- Lasagna mulching

Claim: before planting trees and shrubs, work in organic material to improve soil

- Based on an agricultural model for intensive crop production

Scientific summary
- Hydrology disruption
- Soil subsidence
- Nutrient overload

Claim: Watering during the hottest part of the day will scorch leaves

- Water drops on the leaf surfaces act as tiny magnifying glasses
- Wet leaf surfaces are more likely to burn than dry ones

Fact: Other factors can cause scorch, but not water

Symptoms of water deficit:
- tip and marginal leaf scorch, early leaf abscission
- shoot dieback and stunted growth

Causes of water deficits - all linked to decreased leaf water:
- Soil issues: lack of water, presence of salts, compaction, flooding
- Weather issues: lack of rainfall, high temperature, high light, wind
- Plant issues: poor root health (improperly prepared roots)

Claim: Hügelkultur is an ancient way to grow vegetables sustainably

- About Hügelkultur
  - Invented by a German gardeners and published in a booklet in the 1960’s
  - Promotes a method that doesn’t occur in natural systems
  - Is inherently unstable and therefore not sustainable

Claim: Lasagna mulching creates a healthy, nutrient rich soil

- About lasagna mulching
  - “a no-till method of layering brown and green materials to increase organic matter”
  - Emotional appeal

Scientific summary
- Sheet mulches reduce water and air availability to roots
- Overuse of any nutrient can create soil, plant and water problems

Claim: Native species are the best choices to reduce irrigation needs

Facts:
- Nativeness has nothing to do with irrigation needs
- Urban areas do not have natural environmental conditions
- Native species are often not adapted to urban conditions
Introduced species provide ecological benefits
Vegetation diversity, structure and function more important to biodiversity than nativeness

Claim: Permaculture is an ecology-based approach to gardening

Facts:
Permaculture is a philosophy-based approach to gardening
Includes scientific-sounding terms that are meaningless or incorrect (i.e., pseudoscience)
  Dynamic nutrient accumulators, narcissistic plant species
  Buffer plants, guilds
Practices are not science-based and are damaging to plant and soil health
  Sheet mulching
  Recommended use of noxious weeds and other invasive species

Claim: Water crystals protect plants in heat-stressed, drought-prone situations, by absorbing water, then releasing it gradually as plants need it”

About hydrogels
  Acrylamide polymers
  Absorb large amounts of water
  Used in cosmetics, disposable diapers, tissue enhancement
However, water crystals
  …are broken down quickly by microbes, sunlight and fertilizers, so...
  …are only a temporary fix to droughty soil conditions
Scientific summary
  Variable effectiveness in field studies; no long term benefit
  As crystals dry out, they absorb water from the soil
  Studies have found mulches to be more cost-effective

Science-based alternatives:
Avoid soil tillage and minimize any soil disturbance
If needed, add organic material as a top-dressing - do not incorporate
Manage water carefully
  Watch foliage for signs of wilt and water immediately
  Use residential rainbarrels if legal in your community
Use coarse woody mulches for optimizing soil moisture AND
  Control weeds
  Provide slow release nutrients
  Protect and enhance soil health
  Support native populations of beneficial microbes
